

# INSTRUCTOR'S WORKSHOP

## Overhead sight alignment teaching aid

by Marco Gonzalez, Saltillo, Mexico

When teaching proper sight alignment, it is difficult to explain to students how to move the rear sight in order to hit the bull's-eye. You can easily solve this problem by using simple and inexpensive graphic overheads, which can be improved with color. The important thing is for the students to catch the idea.

### INSTRUCTIONS

- Step 1:** Place overhead No. 1 on top of overhead No. 2.
- Step 2:** Align the front sight on overhead No. 2 with the cross from overhead No. 1.
- Step 3:** Place a permanent tack or similar object in the union of step two.
- Step 4:** Explain the results to your students.
